

GCC-Vision-Report

This software enables you to create a report with digital videos and photos during the inspection. As connection between cable reel and notebook, on which the software is installed, only an USB-cable is required. Video digitalization and all other required components or software features are integrated in the GUL100/300 Compact. By means of the GCC-Vision-Report- Software the complete GeoWellCam-System is controlled and a report is created. As result you have all digital information (report, photos, videos) on your office pc and a freely distributable viewer, which also can be supplied to your customer. The GWC-Vision-Report is available in different languages, the damage catalogues are customizable.

Optional functions are e.g. logging of sensor data (e.g. data from compass inclinometer).
